Protein coding regions (CDS) have been predicted with the help of
Protein coding regions (CDS) have been predicted with the help of
Computer analysis using the Genefinder program in PomBase (an ACEDB
database) with additional predictions for the branch-acceptor sites
supplied by the program Sp3splice. CAUTION: It is possible that for
any individual CDS we may have underestinated or overestimated the
number of introns/exons or we may not have chosen the correct
splice donor/acceptor sites. CDS are numbered using the following
system eg SPAC5H10.01c. SP (S. pombe), A (chromosome 1), c5H10
(cosmid name), .01 (first CDS), c (complementary strand).
The more significant matches with motifs in the PROSITE database
are also included but some of these may be fortuitous. The length
in codons is given for each CDS.
IMPORTANT: This sequence MAY NOT be the entire insert of the
sequenced clone. It may be shorter because we only sequence
overlapping sections once, or longer, because we arrange for a
small overlap between neighbouring submissions. Cosmid c22H10 is
overlapped at the 5' end by cosmid c17G8 and at the 5' end by

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Location/Qualifiers 1.672	over a 672 bp region of gag and a 906 bp region of env for animal 2010 (only the env region was analyzed for isolates ver266 and ver385). Jin et al. note that the viral strain derived from the yellow baboon (animal 2010) clusters with SIV strains of the vervet subtype, including ver266 and ver385, and believe that this is the first evidence for simian-to-simian cross-species	study with strong SIV(agm) seroreactivity. They lived in a national park where yellow baboons and African green monkeys share the same habitat. In this study, molecular characterization was performed for virus derived from one of the SIVagm seroreactive yellow baboons (animal 2010) and from two vervet African green monkeys (animals ver266 and ver385). With this aim in mind, incultured leukovete NAW ass EGP-amphified closed and sequenced	U. Virol. (In press, 1994) full staff_review Two wild yellow baboons from Tanzania were identified in a previous		+	yellow baboon sample SIVbab2010.  U10899 Simian immunodeficiency virus from PCR-amplified DNA extracted from uncultured leukocytes derived from an asymptomatic pregnant female yellow baboon from Tanzania.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to now, HIV-2 sequences have been derived almost solely from cultured isolates. Since cultivation may select against viruses which can not grow in a particular cell type, Gao et al. argue that a greater variation may be elucidated by sequencing virus obtained from uncultured PBMCs. With this aim in mind, peripheral blood samples were collected from 12 HIV-2 seropositive patients (238, 60415K, 60667K, 7312A, 7810A, 7924A, FA, FO784, FT, JA, ON, and PA) from six different West African countries, living in both urban and rural areas. Uncultured PBMC DNA was PCR amplified, and the recombinant clones were manually sequenced. Another portion of the patient 7024 was a between the countries of the patient 7024 was a between was a solation.

Originally he lived in an urban area in West Africa before traveling extensively and coming to the United States. After seeking medical care for a STD, patient 7924 was identified as HIV-2 positive. Subsequent Western blot analysis of peripheral blood cells showed HIV dual reactivity. Virus isolation was successfully performed at the University of Alabama at Birmingham. Simian immunodeficiency virus proviral DNA, isolate TAN-49 from Ugandan tantalus monkey (Cecopithecus tantalus).
Simian immunodeficiency virus
Simian immunodeficiency virus
Viridae; ss-RNA enveloped viruses; Positive strand RNA virus;
Retroviridae; Lentivirinae.

Identification of a new subgroup of SIVagm in tantalus monkeys Virology (1993) In press full staff review
Kindly submitted prior to publication by Dr. Vanessa Hirsch, Immunodeficiency Viruses Section, NIAID/NIH, Twinbrook II, Rockville MD 20852. SIVagm-tan strains cluster with other previously characterized agm strains taken from vervets and grivets. See related tantalus isolate sequences 17, 27, 40, and 9 (accession numbers 119250-L19252, L19254).
                                                                                                       Simian (African green monkey) immunodeficiency virus, extra-
chromosomal closed-circular DNA, TYO-1 clone lambda-SAH12.

form by Phillip Johnson, NIAID/Georgetown University.
The typical stop codon "tag" in rev (position 8574) is "cag"
making rev in SIvgri-1 (lambdaII) longer than rev in most
other sequences. The gri-1 sequence is the most divergent
primate lentivirus reported to date.
primate lentivirus reported to date.
